1.1 Inner Products on a Vector Space

The **Euclidean inner product** on $\mathbb{R}^n$ is defined by

$$\langle u, v\rangle = \sum_1^n u^i v^i, \tag{1}$$

and the length of a vector is

$$\|u\| = \sqrt{\langle u, u\rangle}, \tag{2}$$

the **angle θ** between two vectors is

$$\cos\theta = \frac{\langle u, v\rangle}{\|u\|\|v\|}, \tag{3}$$

the **arc length** of a curve $c(t) \in \mathbb{R}^n$, $a \le t \le b$ is

$$s = \int_a^b \|c'(t)\| dt \tag{4}$$

Definition 1.1. An inner product in a real vector space V is a postive-definite, bilinear and symmetric map: $\langle\cdot,\cdot\rangle : V \times V \to \mathbb{R}$ so that for $u, v, w \in V$ and $a, b \in \mathbb{R}$, satisfies

(i) **Postive-definiteness** $\langle v, v\rangle = 0$ iff. $v = 0$

(ii) **Symmetry** $\langle u, v\rangle = \langle v, u\rangle$

(iii) **Bilinear** $\langle au + bv, w\rangle = a\langle u, w\rangle + b\langle v, w\rangle$

Proposition 1.2. If W is a subspace of V, then the restriction

$$\langle,\rangle_W := \langle,\rangle|_{W\times W} : W \times W \to \mathbb{R}, \tag{5}$$

of an inner product $\langle,\rangle$ on V is also an innver prodcut.

Proof. The subspace construction preserves the properites in Definition 1.1. □

Proposition 1.3. The **nonnegative linear combinition** of inner products $\langle,\rangle_i$ on V: $\langle,\rangle := \sum_{i=1}^{r} a_i\langle,\rangle_i, a_i \geq 0$ is again an inner product on V.

Proof. The **nonnegativity** of a_i preserves condition (i) in Definition 1.1, the linearity makes condition $(ii), (iii)$ hold. □

1.2 Representations of Inner Products by Symmetric Matrices

Let $e_1, \ldots, e_n$ be the basis of vector space V, each vector $x \in V$ can be represented as a column vector

$$x = \sum_{i=1}^{n} x^i e_i \leftrightarrow \mathbf{x} = \begin{bmatrix} x^1 \\ \vdots \\ x^n \end{bmatrix}. \tag{6}$$

Let $\boldsymbol{A}$ be an $n \times n$ matrix whose entries $a_{ij} = \langle e_i, e_j\rangle$, the matrix form of an inner product on V is

$$\langle x, y\rangle = \sum_{ij} x^i y^j \langle e_i, e_j\rangle = \mathbf{x}^\top \boldsymbol{A}\mathbf{y}. \tag{7}$$

We find that, once a basis of V is chosen, the inner product on V determines a postive-definite symmetric matrix. Conversely, an $n \times n$ postive-definite symmetric matrix with a basis of V determines an inner product on V

It follows that there is an one-to-one correspondence

$$\left\{ \begin{array}{c} \text{inner product on a } n\text{-dimensional} \\ \text{vector space} \end{array} \right\} \leftrightarrow \left\{ \begin{array}{c} \text{An } n \times n \text{ postive-definite} \\ \text{symmetric matrix} \end{array} \right\}. \tag{8}$$

Let a basis of dual space $V^\vee := \mathrm{Hom}(V, \mathbb{R})$ be $\alpha^1, \ldots, \alpha^n$ w.r.t. the basis $e_1, \ldots, e_n$ of V, an inner product $\langle , \rangle$ of $x, y \in V$ is

$$\begin{aligned}\langle x, y\rangle &= \sum_{i,j} a_{ij} x^i y^j = \sum_{i,j} a_{ij} \alpha^i(x) \alpha^j(y) \\ &= \sum_{i,j} a_{ij} \alpha^i \otimes \alpha^j(x, y)\end{aligned}$$

In terms of tensor product, an inner product on V may be written as

$$\langle , \rangle = \sum_{ij} a_{ij} \alpha^i \otimes \alpha^j \tag{9}$$

1.3 Riemannian Metrics

1.4 Existence of a Riemannian Metric

1.5 Problems
